

CECOMA 2016

Challenges in the Environmental Management of Coastal and
Marine Areas

LAS PALMAS DE GRAN CANARIA, SPAIN

25-29th January of 2016

TOGETHER WE WILL BUILD A BETTER WORLD

ORGANIZED BY ECOAQUA
&
UNIVERSITY OF LAS PALMAS DE GRAN CANARIA

IN COLLABORATION WITH
IUCN

Table of Contents

PROGRAMME CECOMA 25-29TH JANUARY 2016	1
LOCATION:	6
SESSION 1 - INTEGRATED MANAGEMENT OF COASTAL AND MARINE AREAS	7
INCLUDING AQUACULTURE IN THE MANAGEMENT OF COASTAL AND MARINE AREAS THROUGH THE DEVELOPMENT OF INTEGRATED MULTI-TROPHIC AQUACULTURE.....	8
WHY EXPERIENCE AND KNOWLEDGE MAY CHANGE OUR WAY TO APPROACH THE ENVIRONMENTAL CHALLENGES?	9
THE BIODIVERSITY DATABASE OF THE CANARY ISLANDS. ANALYTICAL TOOLS IN CONSERVATION.	10
MARINE PILOT - MSFD & INSPIRE EXPLORATORY PROJECT	11
ALIEN SPECIES IN THE BALTIC SEA: DANGER OR CHANCE?	12
REGULATING AND MANAGING MARINE LIVING RESOURCES: FIVE DECADES OF TRIUMPH AND FAILURE IN THE EUROPEAN UNION	13
SESSION 2: STRUCTURE AND FUNCTION OF COASTAL & MARINE ECOSYSTEMS	14
THE ROLE OF GLACIATION-RELATED SEA LEVEL OSCILLATIONS IN SHAPING THE PRESENT MACARONESIAN ISLAND BIOTAS	15
OPEN OCEAN FISH FARMING: SOME TECHNICAL CONSIDERATIONS FOR A BETTER UNDERSTANDING OF ENVIRONMENTAL THREATS AND ADVANTAGES.....	16
QUANTITATIVE ANALYSIS OF SEAWEEDS ON THE INTERTIDAL ROCKY COASTS OF SANTIAGO ISLAND, CAPE VERDE ARCHIPELAGO	17
AN 'ENDEMIC' FISH COMMUNITY ASSOCIATED TO SEAGRASS MEADOWS OFF THE CANARY ISLANDS	18
SEASONAL AND SPATIAL PATTERNS IN THE MORPHOLOGY AND LIFE STORY OF THE BROWN MACROALGAE <i>CYTOSEIRA ABIES-MARINA</i> (FUCALES, PHAEOPHYCEAE) IN THE ROCKY INTERTIDAL FROM GRAN CANARIA (EASTERN ATLANTIC): ENVIRONMENTAL DRIVERS OF VARIATION.....	19
SESSION 3 - RESPONSIBLE USE OF COASTAL & MARINE RESOURCES	20
BUILDING GLOBAL NETWORKS OF MPAS: CHALLENGES, ADVANCES AND OPPORTUNITIES	21
THE NEED FOR TECHNICAL AND LEGAL TOOLS TO SUPPORT A COMPETITIVE AND SUSTAINABLE ECOTOURISM ASSOCIATED TO MARINE FARMS AT SPAIN.	22
MODELING THE EFFECTS OF FISHING MANAGEMENT SCENARIOS ON THE GRAN CANARIA MARINE ECOSYSTEM	23
THE REAL IMPACT OF RECREATIONAL FISHERIES IN CANARY ISLANDS	24
FIRST STEPS TOWARDS ENVIRONMENTAL FISHERIES CERTIFICATION CONSIDERING THE STANDARD OF THE MARINE STEWARDSHIP COUNCIL (MSC): THE CASE OF OPTUNA & ISLATUNA, ARTISANAL LIVE BAIT TUNA FLEETS (CANARY ISLANDS, SPAIN)	25
PREPARATORY ACTION FOR THE IMPLEMENTATION OF THE INTERNATIONAL CONVENTION FOR THE CONTROL AND MANAGEMENT OF SHIPS' BALLAST WATER AND SEDIMENTS (BWM CONVENTION): IDENTIFICATION OF SPECIES IN LAS PALMAS PORT.	26
SESSION 4 - EFFECTS OF GLOBAL CHANGE IN COASTAL AND MARINE ECOSYSTEMS.....	27
RESPONSES OF NEARSHORE AND COASTAL BIODIVERSITY AND ECOSYSTEMS TO CLIMATE CHANGE: COMBINING LONG-TERM OBSERVATIONS, EXPERIMENTS AND MODELLING.....	28
LAND-SEA INTERACTIONS IN A CHANGING SCENARIO: NEW CHALLENGES IN THE ENVIRONMENTAL MANAGEMENT OF SHALLOW MARINE COASTAL AREAS.....	29
EFFECTS OF OCEAN ACIDIFICATION ON FEEDING RATES OF JUVENILES SEA URCHINS <i>PARACENTROTUS LIVIDUS</i> AND <i>DIADEMA AFRICANUM</i>	30

RELATIONSHIP INTERSPECIFIC AND ENVIRONMENTAL OF OCTOPUS VULGARIS AND PAGRUS PAGRUS THROUGH CATCHES OF THE GRAN CANARIA FISHING FLEET.....	31
OVEREXPLOITATION OF THE GALAPAGOS SAILFIN GROUPER: THE NEED FOR COMMUNITY BASED COLLABORATIVE EFFORTS TO ESTABLISH MANAGEMENT REGULATIONS.....	32
SESSION 5 - ECOSYSTEM CONSERVATION AND AQUACULTURE	33
HOLISTIC APPROACHES TO UNDERSTAND THE FUNCTIONING AND RESILIENCE OF COASTAL ECOSYSTEMS: FROM GENES TO ECOSYSTEM SERVICES PROVIDED BY SEAGRASS MEADOWS.....	34
DEVELOPMENT OF MARINE AQUACULTURE IN BRAZIL: INSIGHTS ON ENVIRONMENTAL INTERACTIONS.....	35
LARGE SCALE EFFECTS OF AQUACULTURE ESCAPEES ON FISHERIES LANDINGS: EVIDENCES FROM THE MEDITERRANEAN SEA.....	36
COMBINING ECOLOGY AND AQUACULTURE FOR <i>IN SITU</i> MARINE CONSERVATION INITIATIVES: SEAHORSE IN GRAN CANARIA ISLAND (NE ATLANTIC) - A CASE STUDY.....	37
A KINETIC ASSAY FOR NITRATE REDUCTASE (NR) IN <i>ULVA RIGIDA</i>	38
SEA URCHIN <i>DIADEMA AFRICANUM</i> POPULATIONS AT THE SELVAGENS ISLANDS	39
SUSTAINABLE PRODUCTION OF ABALONE <i>HALIOTIS TUBERCULATA COCCINEA</i> IN INTEGRATED MULTI-TROPHIC AQUACULTURE SYSTEMS.....	40
IDH ACTIVITY IN PLANKTONIC ORGANISMS: A NEW PROXY FOR POTENTIAL CO ₂ PRODUCTION AND RESPIRATORY METABOLISM AT THE BASE OF THE FOOD CHAIN	41
SECURING THE FUTURE OF CRITICALLY ENDANGERED ANGEL SHARKS THROUGHOUT THEIR NATURAL RANGE	42
POSEIDON PROGRAM: CITIZEN SCIENCE FOR THE STUDY OF MARINE BIODIVERSITY IN THE CANARY ISLANDS	43
BEST III AND THE CHALLENGES OF DEFINING COASTAL AND MARINE KEY BIODIVERSITY AREAS IN MACARONESIA.....	44
“BIO-BASED ECOSYSTEMS”: AN EUROPEAN CHALLENGE FOR THE 2016-2020 THROUGH SUSTAINABLE INNOVATION IN FOOD, FEED AND BIO-BASED INDUSTRIES WITHIN THE MARINE AND TERRESTRIAL SECTORS. THE CASE OF THE EUROPEAN AQUAPONIC HUB FA 1305.....	45
POSTER SESSION.....	46
P1 - COASTAL SUSTAINABILITY INDICATORS. A PROPOSAL FOR AGRICULTURE AND LIVESTOCK DEVELOPMENT WITHIN THE FRAMEWORK DPSIR (GRAN CANARIA, SPAIN).	47
P2 - COASTAL SUSTAINABILITY INDICATORS. A PROPOSAL FOR TOURISM AND URBAN DEVELOPMENT WITHIN THE FRAMEWORK DPSIR (GRAN CANARIA, SPAIN).....	48
P3 - FEASIBILITY OF DEVELOPMENT OF AN INDIVIDUAL BEHAVIOUR-BASED MODEL OF FERAL HORSES (<i>EQUUS FERUS CABALLUS</i>) IN SABLE ISLAND, NOVA SCOTIA, CANADA.	49
P4 - ARE ZOOPLANKTON SECONDARY PRODUCTION MODELS ABLE TO PREDICT GROWTH IN THE MARINE MYSID <i>LEPTOMYSIS LINGVURA</i> (G.O. SARS, 1866)?	50
P5 - RESPIRATION OF PRIMARY AND SECONDARY PRODUCERS MEASURED BY DIFFERENT METHODOLOGIES.....	51
P6 - IMPACT OF INCREASING <i>p</i> CO ₂ ON MARINE POTENTIAL RESPIRATORY ACTIVITY	52
P -7 IMPACT OF RECREATIONAL FISHING ON FISH POPULATIONS DURING THE LAST 50 YEARS IN CANARY ISLANDS.....	53
P8 - SHELL ALLOMETRIC DIFERENCES IN BROWN MUSSEL UNDER LONGLINE CULTURE REGARDING WILD POPULATION (CANARY ISLANDS, SPAIN).....	54
P9 - DEFINING, ASSESSING AND VALORISING KEY MARINE HABITATS IN THE MACARONESIAN ARCHIPELAGOS.....	55

P8 - SHELL ALLOMETRIC DIFERENCES IN BROWN MUSSEL UNDER LONGLINE CULTURE REGARDING WILD POPULATION (CANARY ISLANDS, SPAIN)

Changes in the morphology of the shell in cultivated mussel may affect the acceptance and value of the product on the market (Cubillo et al. 2012). Furthermore, it could be that when developing new cultures from wild species, morphological changes may cause confusion and even lead to think that they are different species. Also, if the cultures are carried out with protected species, the knowledge of these morphological differences may help to distinguish both origins in the markets, helping the proper management of the resource. This is the case of the brown mussel *Perna perna* (LINNÉ, 1758) which was subject of several studies (Project I, II and III) to assess the possibility of developing this kind of culture in the islands of Fuerteventura (Viera et al. 2009) and Gran Canaria. In the latter, the grown was of small scale and tied to a culture of fish (sea bass) as part of a multitrophic experiment (González et al. 2012). The purpose of this study was to compare the height (H), width (W) and shell weight (SW) relative to the total length (TL) in the natural population (3 cases) and in culture (7 cases). We considered the log-transformed allometric relation ($\log Y = \log a + b \log X$) and the parameters of the line were obtained from Model II regression through Standardised Major Axis (SMA) estimation. The calculations were performed with the R program (R Core Team 2015) and the SMART package (Warton et al. 2012). The data were previously filtered from a minimum size of 25.2 mm, as this was the minimum average size of the starting cultures. Anomalous data were eliminated by graphical methods and then the slopes of the lines were calculated in each case with 95% confidence interval (CI). To assess the sign of the allometry (+, -, =) the slope values were compared to "1" (H and W), and to "3" (SW). In general, as in other studies, the shell of our cultured mussels (the values of the slopes) was rounder and triangular (>H), narrower (<W) and lighter (<SW) than in natural populations. For the W even changes in the allometric sign were observed, + in wild and - in cultured (while in the other two variables was the sign -). These values can be explained because the mussels present in culture have more favorable conditions for growing (less environmental stress) and have a lower age.

Project I ("Estudio de viabilidad del cultivo de mejillón *Perna perna* en Fuerteventura") was co-funded by the FIG (Financial Instrument for Fisheries Guidance) and the EFF (European Fisheries Fund), both of the European Union (EU), and the "Viceconsejería de Pesca de la Consejería de Agricultura, Ganadería, Pesca y Alimentación del Gobierno de Canarias". Projects II ("Acuicultura Integrada: Experiencia Piloto para el desarrollo de sistemas multitroóficos") and III ("Viabilidad del cultivo de *Perna perna* en Canarias") were financed by the "Junta Asesora de Cultivos Marinos" (JACUMAR).

Introduction

The study of the allometric growth is performed by comparing the increases of one body part relative to another and its usefulness for comparing the dimensions of the shell mussels that are developed in different habitats (Seed, 1968). Changes in shell morphology in cultured mussels may affect the acceptance and value of the market product (Cubillo *et al.*, 2012). Furthermore, it could be that when developing new cultures from wild species, morphological changes may cause confusion and even lead to think that they are different species. Also, if the cultures are carried out with protected species, the knowledge of these morphological differences may help to distinguish both origins in the markets, helping the resource to be properly managed. Three different projects were conducted (Project I, II and III) to assess the suitability of the brown mussel *Perna perna* (Linné, 1758) as a potential species for Canarian aquaculture development. The aim of this communication is to report changes in shell allometric characteristics between wild and *longline* cultured brown mussel.

Materials & Methods

Three studies (Project I, II and III) were undertaken in Fuerteventura and Gran Canaria islands. The height (H), width (W) and shell weight (SW) relative to the total length (TL) in the natural population (3 cases) and *longline* culture (7 cases) were compared. We considered the log-transformed allometric relation ($\log Y = \log a + b \log X$) and the parameters of the line were obtained from Model II regression through Standardised Major Axis (SMA) estimation. All data were statistically treated with the R program (R Core Team, 2015) and the SMART package (Warton *et al.*, 2012). The data were previously filtered from a minimum size of 25.2 mm, as this was the minimum average size of the starting cultures. To assess the sign of the allometry (+, -, =) the slope values were compared to "1" (H and W), and to "3" (SW).

Results

Data should be considered as average annual values. Besides, the duration of the experimental culture was not the same therefore our results have a more descriptive value than inferential ones. Regarding to H-TL the slopes values tended to be higher in the case of culture conditions than those in natural populations. In most of the cases the sign of the allometry is negative (<1), except "f" (heteroscedasticity?), "i" and "j" where isometric relationship type (=1) was shown. Concerning W-TL the biggest slopes cases correspond to natural populations. It also highlights the change of the allometric sign being positive (>1) in natural populations, except in the case "c" where it occurs isometrics (=1). In culture conditions have negative allometry (<1), with the exception of the case "j" which also occurs isometrics (= 1). In all cases, PC-TL, presented negative allometry values (<3), but stresses that the highest values of the slopes cases correspond to the wild populations.

Discussion

As previously reported (Seed, 1968; Hickman, 1973) the shell of our cultured mussels was rounder and triangular (>H), narrower (<W) and lighter (<SW) than in natural populations. Probably linked to the higher quantity and availability of food, the less environmental stress and the younger age of the specimens in culture conditions relative to the natural populations. However, in our case, if we consider the island of Fuerteventura, where mussels from natural populations have more food, this is limited to submerged periods. Also, these mussels are under higher stress condition (tides, waves, currents, air exposure, etc.). Hence, in our study, it is no clear enough if the food factor should be considered a major one. Since low density string were used (about 400 initial individuals per meter of rope) being lower than in other culture trial (1.150 Cubillo *et al.*, 2012 or 2.600 Babarro *et al.*, 2000). Therefore our results could be due to both environmental conditions and the higher age of the wild specimens. Indeed, when mussels are reared linked to fish farming where the quantity and availability of food is higher (in preparation), further significant changes in shell shape are detected. However the shell accretion did not vary significantly, suggesting that in culture conditions, its could be mainly influenced by the environmental factors rather than the food disponibility.

Acknowledgments

Project I ("Estudio de viabilidad del cultivo de mejillón *Perna perna* en Fuerteventura") was co-funded by the FIFG (Financial Instrument for Fisheries Guidance) and the EFF (European Fisheries Fund), both of the European Union (EU), and the "Viceconsejería de Pesca de la Consejería de Agricultura, Ganadería, Pesca y Alimentación del Gobierno de Canarias". Projects II ("Acuicultura Integrada: Experiencia Piloto para el desarrollo de sistemas multitroficós") and III ("Viabilidad del cultivo de *Perna perna* en Canarias") were financed by the "Junta Asesora de Cultivos Marinos" (JACUMAR).
